

Invoq

Respond to change. Cook to perfection.

The Invoq oven features CookTimeCorrection technology. Intelligent sensors immediately detect unexpected changes in temperature and correct accordingly. This ensures that quality is always maintained, and energy is conserved, maximising the performance of your oven.

Automated correction for temperature change

The Invoq CookTimeCorrection (CTC) intelligence automatically compensates for irregularities in the temperature crossing the preset thresholds. The sensors detect heat loss during opening and closing of the door to add or remove products as well as increase of temperature as a result of user behaviour. The oven automatically adjusts for the drop or rise in temperature, ensuring a worry-free operation with perfect results every time.

When working with the Recipes function, your CTC will compensate for the full batch in your oven without any attention or additional work needed. You will not even notice it happening. But you will notice the difference. This intelligent feature has been advanced further for preparing various items using the MenuPlanner function, where it even compensates per rack. Smart technology made simple for you!

Certain items are more sensitive to small temperature changes than others, such as rare meats, seafoods and eggs.

Scenario

A new staff member is at work in the supermarket's quick service department. The oven has been preheated and opened for loading. Then the assistant steps away to help a customer. Upon return, he loads the oven but in the meantime the temperature has dropped below the ideal temperature range. CookTimeCorrection now compensates for this irregularity in the recipe program and ensures a perfect result.

Your benefits

- Ensure high quality, every time.
- No waste – only sellable products.
- Intelligent cooking simplifies processes.
- Reach the full potential of your oven.

Combi

- Prevent under- or overcooked products.

Bake

- Prevent burnt edges, products collapsing or unbaked items.

In practice

- Activate the use of CTC and the oven will automatically correct, when needed.
